MEDIA SERVER/VIDEO MAPPER

GREEN HIPPO VIDEOMAPPER

**"It changes the game
in terms of deforming
content..."**

The unique video layout at the 2010 *Super Bowl Halftime Show* was made possible by a new component of the Green Hippo Hippotizer HD media server called VideoMapper. Similar to Hippotizer's PixelMapper™ for DMX fixtures, VideoMapper provides a simple solution for the mapping of multiple LED video displays, tiles, or strips, taking into account their physical arrangement and the physical spaces between them. It supports resolutions up to 8,192x8,192 and frees the designer from the constraints of modern video processor hardware, allowing complete artistic freedom with even the most complex system. "It changes the game in terms of deforming content for any set shape, live and in the moment. Spheres? HA! Try intersected dodecahedrons!" says one awestruck judge who gave it a thumbs-up.
